this historic book may have numerous typos and missing text purchasers can usually download a free scanned copy of the original book without typos from the publisher not indexed not illustrated 1908 edition excerpt with a lower drop in pressure pipe bends curved to a radius of less than five diameters of the pipe are undesirable as expansion contributed to power by william f fischer bends because being so stiff they fail to take up the expansion in the line and a good deal of strain is thrown on the fittings and joints the radius should be at least five or six pipe diameters and if possible even greater than six diameters say ten or twelve in order to give sufficient elasticity anchoring the method of anchoring the steam line and the position of the anchor are important details the line may be so anchored as to throw severe strains on the joints working the gaskets and bolts loose and causing leakage or a broken fitting or cracked flange may be the result making it necessary to cut out one or more units while making repairs many leaky joints can be traced to this cause no special rules can be given for designing

and anchoring for expansion the designer must depend on his own good judgment in placing the bends anchors etc where they will do the most good however a knowledge of the expansion of pipes when heated is essential expansion in fig i there is shown a 10 inch extra heavy steampipe and two clamps a a anchored rigidly to the walls say for example the pipe was placed in the position shown at a temperature of 60 degrees fahrenheit anchored rigidly between one clamp and allowed to move freely through the other when expanding supposing that while in this position steam at 250 pounds pressure above vacuum was turned into it superheated 100 degrees the pipe would heat and cause it to expand and slide through the clamp at the free end the elongation of the pipe due to expansion due to the difference of the above
