the basal ganglia constitute a group of subcortical structures highly interconnected among themselves as well as with the cerebral cortex thalamus and other brain areas these nuclei play a central role in the control of voluntary movement and their specific pathology comprises the group of diseases known as movement disorders including parkinson's disease huntington's disease dystonia and gilles de la tourette syndrome among others additionally the presence of a number of circuits within the basal ganglia related to non motor functions has been acknowledged currently the basal ganglia are thought to participate in cognitive limbic and learning functions moreover disorders related to the basal ganglia are known to involve a number of complex non motor symptoms and syndromes e.g. compulsive and addictive behavior in the light of this evidence it is becoming clear that our knowledge about the basal ganglia needs to be revised and that new pathophysiological models of movement disorders are needed in this context the study of the pathophysiology of the basal ganglia and the treatment of their pathology is becoming increasingly interdisciplinary nowadays an appropriate approach to the study of these problems must necessarily involve the use of complex mathematical modeling computer simulations basic research ranging from biomolecular studies to animal experimentation and clinical research this research topic aims to bring together the most recent advances related to the pathophysiology of the basal ganglia and movement disorders
