the author s previous book random walk in random and non random environments was devoted to the investigation of the brownian motion of a simple particle the present book studies the independent motions of infinitely many particles in the d dimensional euclidean space $\mathbb{R}^d$ in part i the particles at time $t = 0$ are distributed in $\mathbb{R}^d$ according to the law of a given random field and they execute independent random walks part ii is devoted to branching random walks i e to the case where the particles execute random motions and birth and death processes independently finally in part iii functional laws of iterated logarithms are proved for the cases of independent motions and branching processes

discrete quantum walks are quantum analogues of classical random walks they are an important tool in quantum computing and a number of algorithms can be viewed as discrete quantum walks in particular grover s search algorithm these walks are constructed on an underlying graph and so there is a relation between properties of walks and properties of the graph this book studies the mathematical problems that arise from this connection and the different classes of walks that arise written at a level suitable for graduate students in mathematics the only prerequisites are linear algebra and basic graph theory no prior knowledge of physics is required the text serves as an introduction to this important and rapidly developing area for mathematicians and as a detailed reference for computer scientists and physicists working on quantum information theory
