this monograph first published in 1974 is an attempt to demonstrate the usefulness of the theory of stochastic processes in understanding biologic phenomena at various levels of complexity from the molecular to the ecologic level the modeling of biologic systems via stochastic processes allows the incorporation of effects of secondary factors for which a detailed knowledge is missing in the first two chapters of the monograph the authors present the mathematic analysis used in the later chapters the authors attempted to make the chapters self contained and to make the book comprehensive bringing in results derived by different authors using a variety of techniques and notations in later chapters where models of various biologic phenomena are discussed introductory reviews of those phenomena are given for readers with less biologic background nira dyn is a professor of applied mathematics at tel aviv university in israel since 1984 her main field of activity now is geometric modeling her previous research interests were in approximation theory and in mathematical modeling of biological systems she is now serving in the editorial boards of the journal of approximation theory and of the journal computer aided geometric design she wrote more than 130 papers and participated actively in more than 80 conferences and workshops her education was in applied mathematics in israeli institutions b sc from the technion haifa in 1965 m sc from the weizmann institute rehovot in 1967 ph d from the weizmann institute rehovot in 1970

the discipline of stochastic processes is usually treated as a branch of mathematics and there are plenty of books for mathematicians on the subject equally there are very many books both for statisticians and environmental scientists on time series analysis analysing the structure of data sequences where measurements are made at equal time intervals and are free from intermittent behaviour but this book deals with the analysis of events which occur intermittently in time and space through a very wide range of examples drawn from many areas of environmental science in which the role of water

is central the book shows how the same analytical procedures can be applied to very many different problems the book s many examples include analysis of time intervals between el niño events frequency of dry spells the relation between heavy rainfall and flooding occurrences of gravel disturbance in upland trout streams which damages trout spawn deposits and the cellular structure of rainfall the book does not aim to be an exhaustive treatment of all possible applications of stochastic process models in the environmental sciences but should be regarded as a source book its aim is to encourage students and research workers to see how environmental problems can be put into a probabilistic framework and to draw their attention to analogous problems and solutions in other fields of environmental science in which water and the transport of material by water is an essential characteristic

revised and updated to provide a better broader and more elaborate exposure of the subject new to this edition numerous application examples and exercises of stochastic processes in engineering systems and management detailed and current material on markov chains martingales renewal theory queueing and reliability more information on the latest research including the regenerative stochastic inventory system an up to date extensive bibliography and references at each chapter s end
