in this book lawrence sklar demonstrates the interdependence of science and philosophy by examining a number of crucial

problems on the nature of space and time problems that require for their resolution the resources of philosophy and of physics the overall issues explored are our knowledge of the geometry of the world the existence of spacetime as an entity over and above the material objects of the world the relation between temporal order and causal order and the problem of the direction of time without neglecting the most subtle philosophical points or the most advanced contributions of contemporary physics the author has taken pains to make his explorations intelligible to the reader with no advanced training in physics mathematics or philosophy the arguments are set forth step by step beginning from first principles and the philosophical discussions are supplemented in detail by nontechnical expositions of crucial features of physical theories

the first edition 2001 of this title quickly established itself on courses on the philosophy of time and space this fully revised and expanded new edition sees the addition of chapters on zeno's paradoxes speculative contemporary developments in physics and dynamic time making the second edition once again unrivalled in its breadth of coverage surveying both historical debates and the ideas of modern physics barry dainton evaluates the central arguments in a clear and unintimidating way and is careful to keep the conceptual issues throughout comprehensible to students with little scientific or mathematical training the book makes the philosophy of space and time accessible for anyone trying to come to grips with the complexities of this challenging subject with over 100 original line illustrations and a full glossary of terms the book has the requirements of students firmly in sight and will continue to serve as an essential textbook for philosophy of time and space courses

originally published in 1976 this comprehensive study discusses in detail the philosophical mathematical physical logical and theological aspects of our understanding of time and space the text examines first the many different definitions of time that have been offered beginning with some of the puzzles arising from our awareness of the passage of time and shows how time can be understood as the concomitant of consciousness in considering time as the dimension of change the author obtains a transcendental derivation of the concept of space and shows why there has to be only one dimension of time and three of space and why kant was not altogether misguided in believing the space of our ordinary experience to be euclidean the concept of space time is then discussed including lorentz transformations and in an examination of the applications of tense logic the author discusses the traditional difficulties encountered in arguments for fatalism in the final sections he discusses eternity and the beginning and end of the universe the book includes sections on the continuity of space and time on the

directedness of time on the differences between classical mechanics and the special and general theories of relativity on the measurement of time on the apparent slowing down of moving clocks and on time and probability
