a theory of counting nonintersecting lattice paths by the major index and its generalizations is developed we obtain determinantal expressions for the corresponding generating functions for families of nonintersecting lattice paths with given starting points and given final points where the starting points lie on a line parallel to  $x = y$  in some cases these determinants can be evaluated to result in simple products as applications we compute the generating function for tableaux with  $p$  odd rows with at most  $c$  columns and with parts between 1 and  $n$  moreover we compute the generating function for the same kind of tableaux which in addition have only odd parts we thus also obtain a closed form for the generating function for symmetric plane partitions

with at most  $n$  rows with parts between 1 and  $c$  and with  $p$  odd entries on the main diagonal in each case the result is a simple product by summing with respect to  $p$  we provide new proofs of the bender knuth and macmahon ex conjectures which were first proved by andrews gordon and macdonald the link between nonintersecting lattice paths and tableaux is given by variations of the knuth correspondence
