the terms phase transitions and phase transformations are often used in an interchangeable manner in the metallurgical literature in phase transformations transformations driven by pressure changes radiation and deformation and those occurring in nanoscale multilayers are brought to the fore order disorder transformations many of which constitute very good examples of continuous transformations are dealt with in a comprehensive manner almost all types of phase transformations and reactions that are commonly encountered in inorganic materials are covered and the underlying thermodynamic kinetic and crystallographic aspects elucidated shows readers the advancements in the field due to enhanced computing power and superior experimental capability drawing upon the background and the research experience of the authors bringing together a wealth of experience written essentially from a physical metallurgists view point

the perpetual flow of understanding between phase transformation that controls grain microstructures and heat treatment which decides the size of grains microstructures of steels is not well articulated in the perspective of undergraduate students in phase transformations and heat treatments of steels theories of phase transformation have been used to obtain a desirable

phase or combination of phases by performing appropriate heat treatment operations leading to unification of both the concepts further it includes special and critical heat treatment practices case studies local and in service heat treatments curative and preventive measures of heat treatment defects for several common and high performance applications features presents fundamentals of phase transformation in steels analyzes basics of phase transformation due to heat treatment of steel under various environmental conditions explains application of heat treatment for different structural components discusses heat treatment defects and detection emphasizes heat treatment of special steels and in situ heat treatment practices

this collection is organized around the central theme of martensite by design contributions include design microstructure properties advanced processing and manufacturing performance phase transformations and characterization

since 1993 forty nine theological seminaries have created opportunities for high school students to participate in on campus high school theology programs hstps that invite them to engage in serious biblical and theological study many of the young people who take part in these programs go on to become pastoral or lay leaders in their churches what has made these programs so successful especially given the well documented crisis of faith among young people today in this book thirteen contributors many of whom have created or led one of these innovative theology programs investigate answers to this question they examine the pedagogical practices the hstps have in common and explore how they are contributing to the leadership of the church they then show how the lessons gleaned from these successful programs can help churches denominations and seminaries reimagine both theological education and youth ministry

mycology the study of fungi originated as a subdiscipline of botany and was a descriptive discipline largely neglected as an experimental science until the early years of this century a seminal paper by blakeslee in 1904 provided evidence for self incompatibility termed

heterothallism and stimulated interest in studies related to the control of sexual reproduction in fungi by mating type specificities soon to follow was the demonstration that sexually reproducing fungi exhibit mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi the names burgeff kniep and lindegren are all associated with this early period of fungal genetics research these studies and the discovery of penicillin by fleming who shared a nobel prize in 1945 provided further impetus for experimental research with fungi thus began a period of interest in mutation induction and analysis of mutants for bio chemical traits such fundamental research conducted largely with neurospora crassa led to the one gene one enzyme hypothesis and to a second nobel prize for fungal research awarded to beadle and tatum in 1958 fundamental research in biochemical genetics was extended to other fungi especially to saccharomyces cerevisiae and by the mid 1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena
