learning unlearning and re learning curves volume iv of the working guides to estimating forecasting series focuses in on learning curves and the various tried and tested models of wright crawford dejong towill bevis and others it explores the differences and similarities between the various models and examines the key properties that estimators and forecasters can exploit a discussion about learning curve cost drivers leads to the consideration of a little used but very powerful technique of learning curve modelling called segmentation which looks at an organisation s complex learning curve as the product of multiple shallower learning curves perhaps the biggest benefit is that it simplifies the calculations in microsoft excel where there is a change in the rate of learning observed or expected the same technique can be used to model and calibrate discontinuities in the learning process that result in setbacks and uplifts in time or cost this technique is compared with other better known techniques such as anderlohr s equivalent unit learning is another relative new technique that can be used alongside traditional completed unit learning to give an early warning of changes in the rates of learning finally a learning curve can be exploited to estimate the penalty of collaborative working across multiple partners supported by a wealth of figures and tables this is a valuable resource for estimators engineers accountants project risk specialists as well as students of cost engineering

requiring only two learning parameters long learning cycle times the speed error relationship evaluating the cost of learning from the point of view of safety and an examination of learning organizations each chapter is developed from published research and worked examples are used throughout

reviewing and considering the psychology of skill acquisition this book proposes a different theory of mental function demonstrating that the mind is subject to the same natural laws as the physical world it is useful for students and researchers in the cognitive sciences

the power law of practice has been a long standing theory of the learning curve how skill improves with experience despite the general agreement that learning fits a smooth curved pattern there have been specific areas piecewise learning curves improper aggregation and plateaus that have refuted the existence of single smooth learning curves for a given task the present study attempts to generalize strategy specific learning curves to a large longitudinal dataset of games in starcraft 2 a highly complex task with refined measures of skill using novel methodology to balance error across high dimensional measures the ubiquity of the power law of practice is not supported yet shifts in strategy do not account for the lack of power law learning curves the existence of hobbyists people who do not want to become experts is considered as a possible explanation implications of the findings and directions for further research are discussed
