the book is devoted to the theory of algebraic geometric codes a subject formed on the border of several domains of mathematics on one side there are such classical areas as algebraic geometry and number theory on the other information transmission theory combinatorics finite geometries dense packings etc the authors give a unique perspective on the subject

whereas most books on coding theory build up coding theory from within starting from elementary concepts and almost always finishing without reaching a certain depth this book constantly looks for interpretations that connect coding theory to algebraic geometry and number theory there are no prerequisites other than a standard algebra graduate course the first two chapters of the book can serve as an introduction to coding theory and algebraic geometry respectively special attention is given to the geometry of curves over finite fields in the third chapter finally in the last chapter the authors explain relations between all of these the theory of algebraic geometric codes

actions and invariants of algebraic groups second edition presents a self contained introduction to geometric invariant theory starting from the basic theory of affine algebraic groups and proceeding towards more sophisticated dimensions building on the first edition this book provides an introduction to the theory by equipping the reader with the tools needed to read advanced research in the field beginning with commutative algebra algebraic geometry and the theory of lie algebras the book develops the necessary background of affine algebraic groups over an algebraically closed field and then moves toward the algebraic and geometric aspects of modern invariant theory and quotients

this book constitutes the proceedings of the 7th international conference on mathematical software icms 2020 held in braunschweig germany in july 2020 the 48 papers included in this volume were carefully reviewed and selected from 58 submissions the program of the 2020 meeting consisted of 20 topical sessions each of which providing an overview of the challenges achievements and progress in a environment of mathematical software research development and use

this book is concerned with recent advances in fitness landscapes the concept of fitness landscapes originates from theoretical biology and refers to a framework for analysing and visualizing the relationships between genotypes phenotypes and fitness these relationships lay at the centre of attempts to mathematically describe evolutionary processes and evolutionary dynamics the book addresses recent advances in the understanding of fitness landscapes in evolutionary biology and evolutionary computation in the volume experts in the field of fitness landscapes present these findings in an integrated way to make it accessible to a number of audiences senior undergraduate and graduate students in computer science theoretical biology physics applied mathematics and engineering but also researcher looking for a reference or and entry point into using fitness landscapes for analysing algorithms also practitioners wanting to employ fitness landscape techniques for evaluating bio and nature inspired computing algorithms can find valuable material in the book for teaching proposes the book could also be used as a reference handbook

a splintered vision an investigation of u s science and mathematics education is the us report on the curriculum analysis component of the third international mathematics and science study timss which was sponsored by the international association for the evaluation of educational achievement iea the report summarizes data from the timss curriculum analysis and integrates it with teacher questionnaire data from the us japan and germany on science and mathematics topic coverage and instructional practices the authors of a splintered vision discuss and provide evidence of the unfocused nature of us mathematics and science curricular intentions textbooks and teacher practices they offer the premise that producers of us textbooks and curriculum guides have attempted to answer calls for curricular reform by adding new content to already existing materials instead of devoting time to restructuring the materials the authors also suggest that us teachers inundated with a myriad of competing visions are attempting to cover all the topics they confront in their resource documents and to meet all the instructional demands placed on them by those with a stake in education in keeping with the incremental assembly line philosophy in american society us teachers also tend to lean toward a piecemeal approach to education the authors speculate on what such practices may mean for the mathematics and science achievement of us students the work is sure to spur discussion among educational researchers policy makers and others concerned about the future of mathematics and science education in the us

this book has developed from a series of lectures which were given by the author in mechanics mathematics department of the moscow state university in 1981 the course additional chapters in algebra replaced the course gen eral algebra which was

founded by a g kurosh 1908 1971 professor and head of the department of higher algebra for a period of several decades the material of this course formed the basis of a g kurosh s well known book lectures on general algebra moscow 1962 2 nd edition moscow nauka 1973 and the book general algebra lectures of 1969 1970 moscow nauka 1974 another book based on the course elements of general al gebra m nauka 1983 was published by l a skorniakov professor now deceased in the same department it should be noted that a g kurosh was not only the lecturer for the course general algebra but he was also the recognized leader of the scientific school of the same name it is difficult to determine the limits of this school however the lectures of 1962 men tioned above contain some material which exceed these limits eventually this effect intensified the lectures of the course were given by many well known scientists and some of them see themselves as general algebraists each lecturer brought significant originality not only in presentation of the material but in the substance of the course therefore not all material which is now accepted as necessary for algebraic students fits within the scope of general algebra

floor structures account for the majority of all structural material incorporated into a typical building and plate theories provide the information required to design them this comprehensive book provides a wide ranging account of the theoretical aspects of plate and slab theory in essence structural floors followed by a discussion of the construction and design of real plate and slab elements the early chapters discuss kinematics and statics then the theories of elastic and plastic plates and slabs are developed and studied the novel methods described are capable of providing safe lower bounds on the collapse loads for a wide range of shapes and types of floor then follows a discussion of what criteria should be met by a construction method these criteria are used to develop design principles for what is termed the preferred method of construction worked examples and exercises are provided throughout the final sections include more lengthy exercises an extensive annotated bibliography and some brief historical notes on the evolution of the subject
