this book applies a range of ideas about scientific discovery found in contemporary philosophy of science to psychology and related behavioral sciences in doing so it aims to advance our understanding of a host of important methodological ideas as they apply to those sciences a philosophy of local scientific realism is adopted in favor of traditional accounts that are thought to apply to all sciences as part of this philosophy the implications of a commitment to philosophical naturalism are spelt out and a correspondence theory of truth is defended by showing how it helps explain various features of scientific practice the central chapter of the book presents a broad theory of scientific method that comprises the detection of empirical phenomena and their subsequent understanding by constructing explanatory theories through the use of abductive methods this theory of scientific method is then used as a framework to reconstruct the well known qualitative method of grounded theory and to present a systematic perspective on clinical reasoning and case formulation relatedly an abductive or explanationist understanding of methods is employed to evaluate the knowledge credentials of evolutionary psychology in addition the conceptual and methodological foundations of a variety of quantitative methods are examined exploratory factor analysis and tests of statistical significance are given special attention

since the theory of the moiré phenomenon was published it became the main reference book in its field it provided for the first time a complete unified and coherent theoretical approach for the explanation of the moiré phenomenon starting from the basics of the theory but also going in depth into more advanced research results however it is clear that a single book cannot cover the full breadth of such a vast subject and indeed this original volume admittedly concentrated on only some aspects of the moiré theory while other interesting topics had to be left out perhaps the most important area that remained beyond the scope of the original book consists of the moiré effects that occur between correlated random or aperiodic structures these moiré effects are known as glass patterns after leon glass who described them in the late 1960s however this branch of the moiré theory remained for many years less widely known and less understood than its periodic or repetitive counterpart less widely known because moiré effects between aperiodic or random structures are less frequently encountered in everyday s life and less understood because these effects did not easily lend themselves to the same mathematical methods that so nicely explained the classical moiré effects between periodic or repetitive structures

the foundation of evolutionary theory consists solidly of numerous unwarranted and illegitimate assumptions many of which are antagonistic to the facts of nature these assumptions are taught to the public as codified facts of science when they exist only as what if s the author addresses these issues as well as the philosophical roots of this scientific movement that push the theory along keeping it alive by less than scientific means he exposes the farce that a false philosophy not science keeps alive most of the arguments for intelligent design are covered as well as many more id doesn t cover the author also covers various games that evolutionary theorists like to play in their efforts to make evolutionary theory seem scientific he covers equivocation switching the meanings of words around to fit one s means to an end especially the four different meanings of the word evolution utilized by evolutionists to confuse the issue before long anyone caught up into a debate with an evolutionist must concede because of these perfidious tactics according to one scientist this is an excellent book it promises to be a very important book in this area referring to the creation vs evolution controversy dr jerry bergman m s ph d m p h m a m s b s

recent philosophy and history of science has seen a surge of interest in the role of concepts in scientific research scholars working in this new field focus on scientific concepts rather than theories as units of analysis and on the ways in which concepts are formed and used rather than on what they represent they analyze what has traditionally been called the context of discovery rather than or in addition to the context of justification and they examine the dynamics of research rather than the status of the finished research results this volume provides detailed case studies and general analyses to address questions raised by these points such as can

concepts be clearly distinguished from the sets of beliefs we have about their referents what if any sense can be made of the separation between concepts and theories can we distinguish between empirical and theoretical concepts are there interesting similarities and differences between the role of concepts in the empirical sciences and in mathematics what underlying notion of investigative practice could be drawn on to explicate the role of concept in such practice from a philosophical point of view is the distinction between discovery and justification a helpful frame of reference for inquiring into the dynamics of research from a historiographical point of view does a focus on concepts face the danger of falling back into an old fashioned history of ideas
