panel data is a data type increasingly used in research in economics social sciences and medicine its primary characteristic is that the data variation goes jointly over space across individuals firms countries etc and time over years months etc panel data allow examination of problems that cannot be handled by cross section data or time series data panel data analysis is a core field in modern econometrics and multivariate statistics and studies based on such data occupy a growing part of the field in many other disciplines the book is intended as a text for master and advanced undergraduate courses it may also be useful for phd students writing theses in empirical and applied economics and readers conducting empirical work on their own the book attempts to take the reader gradually from simple models and methods in scalar simple vector notation to more complex models in matrix notation a distinctive feature is that more attention is given to unbalanced panel data the measurement error problem random coefficient approaches the interface between panel data and aggregation and the interface between unbalanced panels and truncated and censored data sets the 12 chapters are intended to be largely self contained although there is also natural progression most of the chapters contain commented examples based on genuine data mainly taken from panel data applications to economics although the book inter alia through its use of examples is aimed primarily at students of economics and econometrics it may also be useful for readers in social sciences psychology and medicine provided they have a sufficient background in statistics notably basic regression analysis and elementary linear algebra

written by one of the world s leading researchers and writers in the field econometric analysis of panel data has become established as the leading textbook for postgraduate courses in panel data this new edition reflects the rapid developments in the field covering the vast research that has been conducted on panel data since its initial publication featuring the most recent empirical examples from panel data literature data sets are also provided as well as the programs to implement the estimation and testing procedures described in the book these programs will be made available via an accompanying website which will also contain solutions to end of chapter exercises that will appear in the book the text has been fully updated with new material on dynamic panel data models and recent results on non linear panel models and in particular work on limited dependent variables panel data models

this new edition of this established textbook reflects the rapid developments in the field covering the vast research that has been conducted on panel data since its initial publication the book is packed with the most recent empirical examples from panel data literature for example a simultaneous equation on crime will be added to chapter 7 which will be illustrated with stata data sets will be provided as well as the programs to implement the estimation and testing procedures described in the book on the web site additional exercises will be added to each chapter and their solutions will be provided on the web site the text has also been fully updated with new material on dynamic panel data models and recent results on non linear panel models and in particular work on limited dependent variables panel data models

the second edition of a comprehensive state of the art graduate level text on microeconometric methods substantially revised and updated the second edition of this acclaimed graduate text provides a unified treatment of two methods used in contemporary econometric research cross section and data panel methods by focusing on assumptions that can be given behavioral content the book maintains an appropriate level of rigor while emphasizing intuitive thinking the analysis covers both linear and nonlinear models including models with dynamics and or individual heterogeneity in addition to general estimation frameworks particular methods of moments and maximum likelihood specific linear and nonlinear methods are covered in detail including probit and logit models and their multivariate tobit models models for count data censored and missing data schemes causal or treatment effects and duration analysis econometric analysis of cross section and panel data was the first graduate econometrics text to focus on microeconomic data structures allowing assumptions to be separated into population and sampling assumptions this second edition has been substantially updated and revised improvements include a broader class of models for missing data problems more detailed treatment of cluster problems an important topic for empirical researchers expanded discussion of generalized instrumental variables giv estimation new coverage based on the author s own recent research of inverse probability weighting a more complete framework for estimating treatment effects with panel data and a firmly established link between

econometric approaches to nonlinear panel data and the generalized estimating equation literature popular in statistics and other fields new attention is given to explaining when particular econometric methods can be applied the goal is not only to tell readers what does work but why certain obvious procedures do not the numerous included exercises both theoretical and computer based allow the reader to extend methods covered in the text and discover new insights

data panels are a special type of samples in which the behavior of a certain number of economic agents is followed over time in this way the researcher can perform economic analysis and specify models with the data of cross section or cross section that are obtained when all operators are considered in an instant of time different patterns of behaviour of all players together studied in the different temporal moments may thus be assessed alternatively you can perform the same analysis considering time series given by the evolution of each economic agent throughout all the periods of the sample in the latter case could be considered different patterns for individual to individual behaviour all the time interval of the sample the book focuses on practical aspects of econometrics of panel data presenting variety of solved exercise with the latest software stata sas spss and eviews software was used the remarkable reads as follows models with panel data pure panels and expanded panels comparison between annual samples combinations of cross sections data pool and panels econometric models with panel data panel data models with constant coefficients panel data models with fixed effects panel data models with random effects dynamic panel data models logit and probit panel data models panel data models with eviews eviews and models with panel data panels of constant coefficients fixed effects and random effects eviews and dynamic models with panel data arellano and bond methodology panel data models with stata examples models with panel data logit probit and poisson models with panel data estimation of dynamic panels using the arellano bond methodology panel data models with sas 57 sas and models with paneldata procedure tscsreg sas and models with panel data procedure panel panel data models with spss stability in panel data models structural change unit roots and cointegration structural stability in econometric models unstable models spurious regressions seasonal time series detection of seasonality unit roots tests stable models in the long term the cointegration analysis the error correction models unit roots and cointegration in seasonal series unit roots and cointegration in series with structural change unit roots and cointegration with panel data stationary and seasonality with eviews roots unit cointegration and structural change with eviews eviews and the contrasts of unit roots with panel data cointegration in panel data models unit roots cointegration and structural change with sas sas and unit roots

this volume collects seven of marc nerlove's previously published classic essays on panel data econometrics written over the past thirty five years together with a cogent essay on the history of the subject which began with george biddell airey's monograph published in 1861 since professor nerlove's 1966 *econometrica* paper with pietro balestra panel data and methods of econometric analysis appropriate to such data have become increasingly important in the discipline the principal factors in the research environment affecting the future course of panel data econometrics are the phenomenal growth in the computational power available to the individual researcher at his or her desktop and the ready availability of data sets both large and small via the internet the best way to formulate statistical models for inference is motivated and shaped by substantive problems and understanding of the processes generating the data at hand to resolve them the essays illustrate both the role of the substantive context in shaping appropriate methods of inference and the increasing importance of computer intensive methods

this book aims to fill the gap between panel data econometrics textbooks and the latest development on big data especially large dimensional panel data econometrics it introduces important research questions in large panels including testing for cross sectional dependence estimation of factor augmented panel data models structural breaks in panels and group patterns in panels to tackle these high dimensional issues some techniques used in machine learning approaches are also illustrated moreover the monte carlo experiments and empirical examples are also utilised to show how to implement these new inference methods large dimensional panel data econometrics testing estimation and structural changes also introduces new research questions and results in recent literature in this field

financial data are typically characterised by a time series and cross sectional dimension accordingly econometric modelling in finance requires appropriate attention to these two or occasionally more than two dimensions of the data panel data techniques are developed to do exactly this this book provides an overview of commonly applied panel methods for financial applications including popular techniques such as fama macbeth estimation one way two way and interactive fixed effects clustered standard errors instrumental variables and difference in differences panel methods for finance a guide to panel data econometrics for financial applications by marno verbeek offers the reader focus on panel methods where the time dimension is relatively small a clear and intuitive exposition with a focus on implementation and practical relevance concise presentation with many references to

financial applications and other sources focus on techniques that are relevant for and popular in empirical work in finance and accounting critical discussion of key assumptions robustness and other issues related to practical implementation

the aim of this volume is to provide a general overview of the econometrics of panel data both from a theoretical and from an applied viewpoint since the pioneering papers by edwin kuh 1959 yair mundlak 1961 irving hoch 1962 and pietro balestra and marc nerlove 1966 the pooling of cross sections and time series data has become an increasingly popular way of quantifying economic relationships each series provides information lacking in the other so a combination of both leads to more accurate and reliable results than would be achievable by one type of series alone over the last 30 years much work has been done investigation of the properties of the applied estimators and test statistics analysis of dynamic models and the effects of eventual measurement errors etc these are just some of the problems addressed by this work in addition some specific difficulties associated with the use of panel data such as attrition heterogeneity selectivity bias pseudo panels etc have also been explored the first objective of this book which takes up parts i and ii is to give as complete and up to date a presentation of these theoretical developments as possible part i is concerned with classical linear models and their extensions part ii deals with nonlinear models and related issues logit and pro bit models latent variable models duration and count data models incomplete panels and selectivity bias point processes and simulation techniques
