it is recognized that the study of mechanical engineering is built of a number of engineering sciences some of which are of basic nature whereas some other are of applied nature basic thermodynamics and basic fluid dynamics are probably the two most important basic engineering sciences in the build of a mechanical power engineer in applied mechanical power engineering sciences the principles introduced and analysed in these two basic sciences are common divisors in other words we may look at these two branches of basic engineering sciences as two legs on which mechanical power engineering applications appear to stand the science of basic thermodynamics is based mainly on a number of basic principles in the form of laws that lead to a number of equations describing and governing the behavior

of several mechanical power systems it is therefore of particular importance to introduce and analyse such equations it is also essential to relate these principles and equations to each other and whenever possible to pertinent phenomena and applications this may be achieved via worked examples that stem from from engineering practice the science of basic fluid dynamics is another basic engineering science of equal importance to basic thermodynamics the principles introduced and analysed by this basic science find applications in almost all applied mechanical power engineering sciences examples of these applied sciences are applied thermodynamics applied fluid dynamics combustion engineering turbo machinery refrigeration and air conditioning power plants gas dynamics propulsion systems etc because of the close inter relation between the science of basic thermodynamics and the science of basic fluid dynamics it has become a common practice to contained both sciences in one textbook under the title basic thermo fluid dynamics the title of the present textbook the present textbook on basic thermo fluid dynamics has been divided into distinct parts a and b in part a we concentrate on basic thermodynamics attempting to present with as much clarity as possible the basic principles therein and giving several worked examples for the sake of clarification in part b we concentrate on basic fluid dynamics applying the same philosophy as in part a in this part also a special section in chapter five containing a rather concise manipulation of the applied science of compressible fluid gas dynamics is presented being an important combined application of the basic principles discussed in thermodynamics and fluid dynamics moreover it was felt by the authors that it is particularly important to include this section on gas dynamics since in spite of being applied in nature it is regarded by many as basic more than applied the last chapter of part a and chapter five of part b cover some important engineering applications of the principles given apriori each of these applications may be looked upon as a brief exposition of an applied engineering science carrying the title of the application under consideration this was felt imperative to the advantage hopefully to be gained by the student the authors are indebted to their colleague dr mohammad s h emeara of the mechanical power engineering department zagazig university for assisting with part of the illustrations and wish to thank him for rendering this assistance in the early stages of preparation of this textbook

based on the latest version of designing codes both for buildings and bridges gb50010 2010 and jtj d62 2004 this book starts from steel and concrete materials whose properties are very important to the mechanical behavior of concrete structural members step by step analysis of reinforced and prestressed concrete members under basic loading types tension compression flexure shearing and torsion and environmental actions are introduced the characteristic of the book that distinguishes it from other textbooks on concrete structures is that more emphasis has been laid on the basic theories of reinforced concrete and the application of the basic theories in design of new structures and analysis of existing structures examples and problems in each chapter are carefully designed to cover every important knowledge point as a basic course for undergraduates majoring in civil engineering this course is different from either the previously learnt mechanics courses or the design courses to be learnt compared with mechanics courses the basic theories of reinforced concrete structures cannot be solely derived by theoretical analysis and compared with design courses this course emphasizes the introduction of basic theories rather than simply being a translation of design specifications the book will focus on both the theoretical derivations and the engineering practices
