the year 1897 was marked by two important mathematical events the publication of the first paper on representations of finite groups by ferdinand georg frobenius 1849 1917 and the appearance of the first treatise in english on the theory of finite groups by william burnside 1852 1927 burnside soon developed his own approach to representations of finite groups in the next few years working independently frobenius and burnside explored the new subject and its applications to finite group theory they were soon joined in this enterprise by issai schur 1875 1941 and some years later by richard brauer 1901 1977 these mathematicians pioneering research is the subject of this book it presents an account of the early history of representation theory through an analysis of the published work of the principals and others with whom the principals work was interwoven also included are biographical sketches and enough mathematics to enable readers to follow the development of the subject an introductory chapter contains some of the results involving characters of finite abelian groups by lagrange gauss and dirichlet which were part of the mathematical tradition from which frobenius drew his inspiration this book presents the early history of an active branch of mathematics it includes enough detail to enable readers to learn the mathematics along with the history the volume would be a suitable text for a course on representations of finite groups particularly one emphasizing an historical point of view co published with the london mathematical society members of the lms may order directly from the ams at the ams member price the lms is registered with the charity commissioners

the deep and original ideas of norman levinson have had a lasting impact on fields as diverse as differential integral equations harmonic complex stochastic analysis and analytic number theory during more than half a century yet the

extent of his contributions has not always been fully recognized in the mathematics community for example the horseshoe mapping constructed by stephen smale in 1960 played a central role in the development of the modern theory of dynamical systems and chaos the horseshoe map was directly stimulated by levinson s research on forced periodic oscillations of the van der pol oscillator and specifically by his seminal work initiated by cartwright and littlewood in other topics levinson provided the foundation for a rigorous theory of singularly perturbed differential equations he also made fundamental contributions to inverse scattering theory by showing the connection between scattering data and spectral data thus relating the famous gel fand levitan method to the inverse scattering problem for the schrodinger equation he was the first to analyze and make explicit use of wave functions now widely known as the jost functions near the end of his life levinson returned to research in analytic number theory and made profound progress on the resolution of the riemann hypothesis levinson s papers are typically tightly crafted and masterpieces of brevity and clarity it is our hope that the publication of these selected papers will bring his mathematical ideas to the attention of the larger mathematical community
