bacterial energetics deals with bacterial energetics and the molecular basis of how ions move between and within energy transducing molecules topics covered range from respiration driven proton pumps and primary sodium pumps to light driven primary ionic pumps bacterial transport atpases and bacterial photosynthesis sodium coupled cotransport and ion exchange systems in prokaryotes are also considered this volume is comprised of 17 chapters and begins with an analysis of the pumps and processes that establish electrochemical ion gradients across bacterial membranes followed by a discussion on the major types of bioenergetic work that utilize these gradients the energetics of periplasmic transport systems chemolithotrophs methanogens and protein insertion and translocation into or across membranes are also examined along with bioenergetics in extreme environments such as high pressure and high temperature environments energetic problems of bacterial fermentations energetics of bacterial motility and energetics of the bacterial phosphotransferase system in sugar transport and the regulation of carbon metabolism this book should be of interest to molecular biologists and biochemists

the properties of materials depend on the nature of the macromolecules small molecules and inorganic components and the interfaces and interactions between them polymer chemistry and physics and inorganic phase structure and density are major factors that influence the performance of materials in addition molecular recognition organic inorganic interfaces and many other types of interactions among components are key issues in determining the properties of materials for a wide range of applications materials requirements are becoming more and more specialized to meet increasingly demanding needs from specific environmental stresses to high performance or biomedical applications such as matrices for controlled release tissue scaffolds one approach to meet these performance criteria is to achieve better control over the tailoring of the components and their interactions that govern the material properties this goal is driving a great deal of ongoing research in material science laboratories in addition control at the molecular level of interactions between these components is a key in many instances in order to reach this goal since traditional approaches used to glue stitch or fasten parts together can no longer suffice at these new levels of manipulation to achieve higher performance in many cases molecular recognition and self assembly must begin to drive these processes to achieve the levels of control desired this same need for improved performance has driven nature over millennia to attain higher and higher complexity

this volume is one of those published from the proceedings of the invited lectures to the first international congress of comparative physiology and biochemistry organized at Liege Belgium in August 1984 under the auspices of the section of comparative physiology and biochemistry of the International Union of Biological Sciences in a general foreword to these different volumes it seems to me appropriate to consider briefly what may be the comparative approach living organisms beyond the diversity of their morphological forms have evolved a widespread range of basic solutions to cope with the different problems both organismal and environmental with which they are faced soon after the turn of the century some biologists realized that these solutions can be best comprehended in the framework of a comparative approach integrating results of physiological and biochemical studies done at the organismic cellular and

molecular levels the development of this approach amongst both physiologists and biochemists remained however extremely slow until recently
