the aim of software engineering is the provision and investigation of methods for the development of software systems of high quality with correctness as a key issue a system is called correct if it does what one wants if it meets the requirements to achieve and to guarantee correct systems the need of formal methods with rigorous semantics and the possibility of verification is widely accepted algebraic specification is a software engineering approach of this perspective when Liskov and Zilles Guttag and the ADJ group with Goguen Thatcher Wagner and Wright introduced the basic ideas of algebraic specification in the mid seventies in the U S A and Canada they initiated a very successful and still

flourishing new area in the late seventies algebraic specification became a major research topic also in many european countries originally the algebraic framework was intended for the mathematical foundation of abstract data types and the formal development of first order applicative programs meanwhile the range of applications has been extended to the precise specification of complete software systems the uniform definition of syntax and semantics of programming languages and to the stepwise development of correct systems from the requirement definitions to the running programs the activities in the last 25 years have led to an abundance of concepts methods approaches theories languages and tools which are mathematically founded in universal algebra category theory and logic
